2007 - 2008 Texas Influenza Surveillance Information

Influenza Surveillance Report for MMWR Week 15

The influenza (flu) activity level for Texas for the week ending April 12, 2008 was "local." Local activity indicates that a single region of the state had increased influenza-like illness (ILI) and recent culture-confirmed influenza. During week 15, 43 (11.6%) specimens tested by NREVSS laboratories in Texas were positive for influenza. The percentage of visits due to influenza-like illness (ILI) as reported by SPSN providers in Texas was below the regional baseline. Flu activity in Texas in week 15 continued to decrease in most regions.

Reports from Health Service Regions

Reports were received from all Health Service Regions (HSRs) for week 15. HSR 1 reported the same level of flu activity as week 14. All other regions reported a decrease in overall flu activity compared to week 14. For a map of Health Service Regions, please visit the following website:

http://www.dshs.state.tx.us/regions/state.shtm

Laboratory Results

During week 15, thirteen hospital laboratories and public health agencies across Texas reported conducting a total of 372 influenza tests (antigen, culture, and PCR) to the National Respiratory and Enteric Virus Surveillance System (NREVSS 1) sponsored by the Centers for Disease Control and Prevention (CDC). Of the 343 antigen detection tests performed, 18 were positive for influenza A/not subtyped and 24 were positive for influenza B. These results were reported from Bell, Bexar, Collin, Dallas, Ellis, Harris, Lubbock, Nueces, Tarrant, Webb, and Wilson counties. A total of nine reports of culture–confirmed influenza were received from the Texas Department of State Health Services (DSHS) Laboratory, Scott and White Hospital Laboratory, and Texas Children's Hospital Laboratory for the following counties:

Influenza A/H1	Influenza A/H3	Influenza A/not subtyped	Influenza B
(None)	(None)	(None)	Bell County
			Cameron County
			Harris County (6)
			Wichita County

Additional positive results from point-of-care rapid flu tests were reported by providers throughout the state (see Texas map below).

Antigenic Characterization

CDC has reported antigenic characterization results from 35 influenza isolates [8 influenza A/H1, 24 influenza A/H3, and 3 influenza B viruses] received from the DSHS Laboratory since the beginning of the 2007–08 flu season.

Influenza A/H1 [8]

• Eight (100%) of the eight viruses were characterized as A/Solomon Islands/3/2006, the influenza A/H1 component of the 2007–08 influenza vaccine for the Northern Hemisphere.

Influenza A/H3 [24]

- Two (8%) of the 24 viruses were characterized as A/Wisconsin/67/2005–like, the influenza A/H3 component of the 2007–08 influenza vaccine for the Northern Hemisphere.
- Twenty-one (88%) of the 24 viruses were characterized as A/Brisbane/10/2007-like. A/Brisbane/10/2007 is a recent antigenic variant which evolved from A/Wisconsin/67/2005-like.
- One (4%) of the 24 viruses showed somewhat reduced titers with antisera produced against A/Wisconsin/67/2005 and A/Brisbane/10/2007.

Influenza B (B/Victoria/02/87 and B/Yamagata/16/88 lineages) [3]

Victoria lineage [0]

• The influenza B component for the 2007–08 influenza vaccine is a B/Malaysia/2506/2004–like virus, belonging to the B/Victoria lineage.

Yamagata lineage [3]

• Three (100%) of the three viruses were identified as belonging to the B/Yamagata lineage of viruses.

These results are very similar to national antigenic characterization results. The national results may be found in the CDC weekly flu report at http://www.cdc.gov/flu/weekly/. The DSHS Laboratory sends a representative sample of influenza viruses to the CDC throughout the flu season.

Influenza-Associated Pediatric Mortality

No influenza—associated pediatric fatalities were reported during week 15. As of week 15, Texas has reported seven influenza—associated pediatric deaths in the 2007–08 influenza season.

School Closures and Institutional Outbreaks

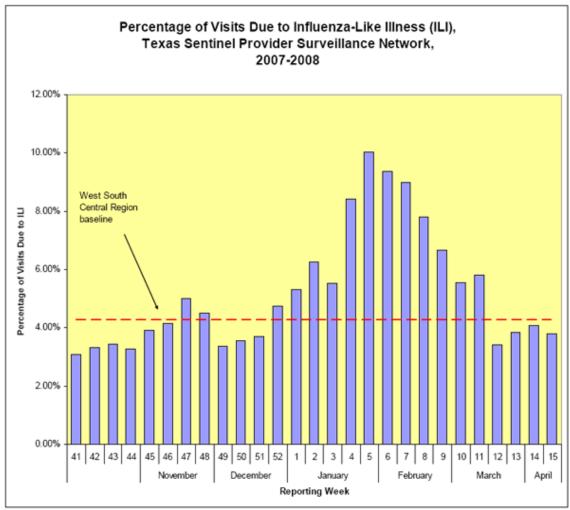

No school closures or institutional outbreaks were reported during week 15.

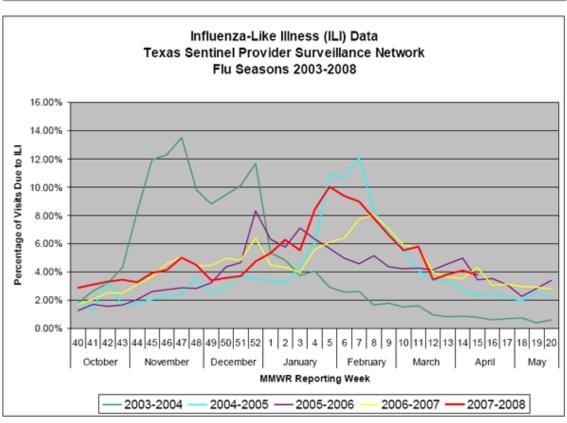

Sentinel Provider Surveillance Network

Sixty–four sentinel providers in Texas reported data to the U.S. Influenza Sentinel Provider Surveillance System (SPSN) on patients with influenza-like illness (ILI) and total patients seen for any reason during week 15; of those, 32 (50%) providers saw at least one patient with ILI. Of all patient visits during this week, 3.79% were due to ILI. The ILI baseline for the West South Central Region (Arkansas, Louisiana, Oklahoma, and Texas) of the United States is 4.3% for the 2007–2008 season. The baseline is the mean percentage of patient visits for ILI during non–influenza weeks for the previous three seasons plus two standard deviations.

Percentage of Influenza-Like Illness (ILI) Reported by Sentinel Providers in Texas as of (4/23/2008 9:44:48 AM)								
Week	# Reporting	Age 0-4	Age 5- 24	Age 25-64	Age over 64	Total ILI	Total Patients	% ILI
